

Cars Reservation

By Mario Frem and Elio Sarkis

Description:

We own a car rental company. We are projecting to create both a website and an android mobile application to make it easier for our customers to rent a car.

Key Features:

- Customers can create an account to log in. Each customer's username and email are unique, and he/she can use either one alongside their password to log in.
- Customers can browse for cars by brands, and then find a specific car by multiple search filters.
- Customers can see a list of their current reservations, as well as a list of their past reservations (in a "history" section).
- Administrators share same privileges with customers, and can, in addition, manage users, brands, cars and reservations. Each of the previously mentioned have a page on their own and can only be seen by administrators.

NOTE: Additional Key Features will be added progressively throughout the project.

Secondary Features:

Secondary features are going to feature in our project, but will remain unannounced until the project's deadline.
